The Quest Archive Management Suite includes:

• Archive Manager
• Recovery Manager for Exchange
• MessageStats
• MessageStats Report Pack for
   Archive Manager

Quest® Archive Management Suite

Capture, Discover and Report on All End-User Data

The numbers don't lie: archiving is growing in importance to organizations. In 2006, organizational e-mail accounts handled an average of 14.7MB of e-mail data per day – 53 percent growth over 2005. A whopping 68 percent of an organization's unstructured data consists of unmanaged files and e-mail. And about75 percent of corporate intellectual property is transmitted via e-mail. Whether the catalyst is storage savings and improving e-discovery response times, or improving the end-user experience and sharing information between business applications, the vast amount of uncontrolled data must be managed.

IT administrators need to proactively archive all types of organizational data so it is securely and efficiently retained for a designated period of time. They need a solution to capture all e-mail and files that come into the organization, tag the data according to future needs, centralize it in a searchable repository, and retain it for no longer than required by policy. Since some data is stored in offline backups, this archive solution should also allow IT administrators to discover from tape, back-fill the archive with historical data from current mailboxes, back-up media and PST files, and pull network files into the archive. Lastly, IT administrators must be able to report on the archive database to better anticipate growth.

Quest's Archive Management Suite discovers all end-user data, captures it and reports on critical messaging and file systems. It's the only solution you'll need to reduce storage costs and improve efficiency in e-discovery.

Archiving
Quest® Archive Manager captures, indexes and stores end-user data, including files and e-mail, helping you to control data volumes, reduce storage management costs and quickly respond to discovery or compliance requests. Through secure information sharing, Archive Manager empowers you to access and leverage the knowledge buried in e-mail.

Recovery/Discovery
Discover and recover messages quickly using Quest® Recovery Manager for Exchange. This robust tool allows you to restore individual, message-level items — including e-mails, appointments, tasks, contacts and attachments — from regular Exchange backups and un-mounted .edb information stores. And you can do so without setting up a dedicated Exchange recovery server. This capability helps you to reduce the cost of e-discovery as well as provide end users with message-level data recovery services.

Reporting and Analysis
With MessageStats™, you can analyze mission-critical e-mail traffic and report on it. MessageStats provides both business and technical reports based on extensive data gathered from the entire messaging organization and the archive, as well as optimized in SQL-based storage. Its Report Pack for Archive Manager also provide insight into service delivery times, traffic flow, storage capacity, inventory, financials and e-mail usage so you can manage your messaging environment to meet strategic objectives.

QUEST SOFTWARE®

Archive Manager

ZeroIMPACT™ Archiving: Capture and manage new and historical data with no impact on end users.

Controlled Access to Data: Ensure data is secured and share business intelligence with greater ease by setting granular permissions to the archives.

Extensive Data Discovery: Manage data consistently with searching and reporting tools that facilitate discovery of items previously available only to end users.

Single-Instance Storage: Reduce storage requirements through the ability to keep a single copy of all messages and attachments.

Improved Performance and Stability: Decrease storage volume of e-mails and the load on your messaging servers.

Recovery Manager for Exchange

Message-Level Recovery: Restore mailbox content selectively — including e-mail messages, contacts, public folders, notes, calendar entries and attachments — to a specified location, without disrupting the existing mailbox content.

No Need for a Recovery Server: Easily search, select and restore messages without using an Exchange recovery server — saving both time and hardware costs.

Backup Support: Recover content from full, incremental or differential backups, including regular Exchange backups, offline .edb files and MTF-compliant backup tapes; also, minimize storage space, cost, effort and time restoring backups, as well as eliminate the need to modify backup procedures.

Powerful Search Engine: Find content in a single mailbox, single folder or all mailboxes in an information store via any combination of search criteria; select and restore search results directly from the search results list.

MessageStats

Customizable At-A-Glance Dashboards: Find information fast using enterprise reporting dashboards; customize reports with over 400 graphs and tables representing every aspect of Exchange operations.

Executive Summary Reports: Use top-level metrics to confirm operational success in service delivery, understand messaging system traffic and capacity, and model financials for your Exchange environment.

Business Unit Reporting: Understand how e-mail facilitates your business objectives via multiple reporting perspectives and several levels of Exchange data.
